

Type 2 Diabetes Management Guideline 2026

Care360 Health System | Confidential Clinical Record

Patient ID: N/A (Reference)

Date: 2026-01-01

Section 1: Screening and Diagnosis

Diagnose type 2 diabetes with HbA1c $\geq 6.5\%$, fasting plasma glucose ≥ 126 mg/dL, or a 2-hour plasma glucose ≥ 200 mg/dL during an oral glucose tolerance test. Confirm with repeat testing unless unequivocal hyperglycemia is present.

Section 2: Glycemic Targets

A general HbA1c goal of $< 7.0\%$ is recommended for most non-pregnant adults. Individualize targets to $< 8.0\%$ for patients with limited life expectancy, extensive comorbidities, or history of severe hypoglycemia.

Section 3: Pharmacologic Therapy

Metformin remains first-line therapy. Add a GLP-1 receptor agonist or SGLT2 inhibitor for patients with established cardiovascular or renal disease regardless of HbA1c. Escalate therapy every three months until targets are met.

Section 4: Monitoring

Measure HbA1c at least twice yearly for patients at goal and quarterly for those with therapy changes or above target. Perform annual urine albumin-to-creatinine ratio, eGFR, and comprehensive foot and dilated eye examinations.
