

Hypertension Management Guideline 2026

Care360 Health System | Confidential Clinical Record

Patient ID: N/A (Reference)

Date: 2026-01-01

Section 1: Blood Pressure Classification

Normal: < 120/80 mmHg. Elevated: 120-129/<80 mmHg. Stage 1: 130-139/80-89 mmHg. Stage 2: $\geq$ 140/90 mmHg. Diagnosis should be based on the average of two or more readings on separate occasions.

Section 2: Treatment Thresholds

Initiate pharmacologic therapy at $\geq$ 130/80 mmHg for patients with clinical cardiovascular disease or a 10-year ASCVD risk $\geq$ 10%. For others, treat at $\geq$ 140/90 mmHg alongside lifestyle modification.

Section 3: First-Line Agents

Preferred first-line classes include ACE inhibitors, ARBs, thiazide-type diuretics, and calcium channel blockers. For patients with diabetes and albuminuria, an ACE inhibitor or ARB is preferred.

Section 4: Follow-up and Monitoring

Reassess blood pressure monthly after initiating or changing therapy until control is achieved, then every three to six months. Encourage validated home blood pressure monitoring and review adherence at each visit.
